Week – 01

Success and Failure Stories of Software Applications

1. Success Story of Canva

Canva is an online graphic design platform founded in **2013** by **Melanie Perkins**. It was created to solve a major problem in the design industry: professional design tools were expensive, complex, and inaccessible to non-designers.

Canva focused on **simplicity, accessibility, and affordability**. It introduced a **freemium model**, allowing users to create designs for free using ready-made templates, while offering premium features for advanced needs. The platform is cloud-based, which eliminated the need for heavy software installations. Canva targeted students, teachers, small businesses, marketers, and non-professionals who needed quick and effective design solutions.

Beyond its initial simplicity, Canva's long-term success can be attributed to its **platform ecosystem strategy**. The company gradually evolved from a basic design tool into a full creative workspace by introducing features such as brand kits, collaborative design, cloud storage, and third-party integrations. This allowed teams and organizations to standardize their visual identity while maintaining ease of use. Canva also leveraged data-driven product decisions, continuously improving templates and features based on real user behavior rather than assumptions.
Another major factor behind Canva's growth is its **global localization and education-first approach**. Canva invested heavily in supporting multiple languages, regional templates, and educational institutions through free access programs. By embedding itself in schools, universities, and small businesses early, Canva created long-term user dependency and brand loyalty. This strategic focus transformed Canva from a simple design tool into a globally dominant creative infrastructure.

Canva's success highlights the importance of **understanding user problems**, keeping technology simple, and scaling globally with affordability. Continuous innovation and user-centric design helped Canva become one of the **most valuable design platforms in the world**, turning Melanie Perkins into a billionaire entrepreneur.

---

2. Success Story of Spotify

Spotify is a digital music streaming platform founded in **2006** in Sweden by **Daniel Ek**. Spotify provides access to millions of songs, podcasts, and playlists through legal streaming, replacing illegal downloads.

Spotify became successful by offering a **legal alternative to piracy**, allowing users to stream music instead of purchasing individual songs. Its **personalized recommendation algorithms**, curated playlists, and ad-supported free tier attracted millions of users. The affordable subscription model and strong partnerships with music labels helped Spotify scale globally.

Spotify's success demonstrates the power of **technology-first thinking**, personalization, and adaptable business models. By behaving like a **technology company first and a media company second**, Spotify transformed how people consume audio content and built a multi-billion-dollar global empire.

Spotify's competitive advantage lies in its **deep investment in data analytics and machine learning**. The platform continuously analyzes listening behavior to optimize discovery features such as Discover Weekly, Release Radar, and personalized playlists. These systems not only enhance user engagement but also reduce churn by making the platform feel uniquely tailored to each individual. Spotify's algorithmic intelligence became a core asset that competitors struggled to replicate.
In addition, Spotify adopted a **two-sided marketplace strategy**, balancing the needs of both listeners and creators. By offering analytics dashboards, promotional tools, and monetization options for artists and podcasters, Spotify positioned itself as a growth partner rather than just a distributor. This strategic alignment with creators strengthened its catalog, improved content exclusivity, and reinforced Spotify's dominance in the global audio streaming industry.

3.Failure Story of Byju's

Byju's is an Indian education technology company founded in **2011** by **Byju Raveendran**. Initially, it became one of the most valuable ed-tech companies in the world by offering online learning for competitive exams such as JEE, NEET, and school curricula.

However, Byju's downfall began due to **aggressive expansion, excessive spending, poor financial management, and unethical sales practices**. The company faced serious allegations related to misleading subscriptions, customer complaints, mass layoffs, and lack of transparency with investors. Rapid acquisitions without proper integration weakened its core operations.

A critical internal weakness at Byju's was the **disconnect between product quality and revenue pressure**. Instead of refining learning outcomes and user experience, the company prioritized aggressive sales targets and valuation metrics. This led to declining educational effectiveness, rising refund disputes, and erosion of brand credibility among parents and students. When growth slowed, the lack of a strong pedagogical foundation became painfully evident.
Furthermore, Byju's failure highlights the dangers of **financial opacity and governance failure** in high-growth startups. Delayed financial disclosures, strained auditor relationships, and mounting debt reduced investor confidence and triggered regulatory scrutiny. In technology-driven businesses, capital can accelerate growth, but without transparency and accountability, it magnifies collapse. Byju's serves as a cautionary example of how misaligned incentives and poor governance can dismantle even market leaders.

The collapse of Byju's did not happen overnight; it **rotted slowly from within**. Growth without foundation, sales without ethics, scale without control, and money without accountability ultimately led to a massive decline in valuation. The Byju's case shows how violating principles of **sustainable growth** can destroy even the most successful startups.

---

4. Failure Story of Path

Path was a social networking application launched in **2010**, designed as a private alternative to Facebook. Path limited users to close connections and focused on intimacy, high-quality design, and personal sharing.

Path's downfall began when it was discovered that the app had **uploaded users' contact data to its servers without proper consent**. This resulted in a major privacy scandal, legal penalties, and loss of user trust. Despite branding itself as a privacy-focused platform, this incident destroyed its credibility.

With increasing competition from Facebook and Instagram, declining engagement, and damaged reputation, Path officially shut down in **2018**. This failure proves that **innovation and design alone are not enough**—user trust, transparency, and ethical data handling are critical for long-term survival. Path's downfall also stemmed from a **misalignment between brand promise and system behavior**. While the platform marketed itself as intimate and private, its backend data practices contradicted this narrative. In software products, especially social platforms, trust is not a feature—it is a foundational requirement. Once violated, even superior design and niche positioning cannot recover lost credibility. Additionally, Path failed to adapt to the **rapidly evolving social media landscape**. Competitors like Facebook and Instagram quickly copied key features while leveraging their massive user bases and stronger network effects. Path's limited scalability, combined with declining engagement and reduced investor confidence, made long-term survival unsustainable. The case proves that ethical compliance, scalability, and competitive adaptability are as critical as innovation.

Conclusion

These success and failure stories demonstrate that **technology alone does not guarantee success**. Sustainable growth, ethical practices, user trust, and long-term vision determine whether a software product becomes a global leader or collapses over time.

02). Enact the importance of ethical practices

Ethical Practice Standards

 Each standard progresses through four levels of impact:

Foundation Level

 At this level you will:

 Take responsibility for your actions

 Act consistently with relevant regulations and law

 Handle personal data and information in a professional manner

 Demonstrate honesty in dealings with others

Associate Level

 At this level you will:

 Make responsibility choices about your work, apply principles and values.

 Consider the purpose and implication of actions, decisions and people practices for all stakeholders.

 Provide explanations and reasons for the choices you make and the advice you provide.

 Demonstrate professionalism and consistency in what you say and do in order to build trust.

Chartered Member Level

 level you will:

 Make responsible decisions by considering different ethical perspectives, and finding the best possible way forward for all stakeholders.

 Coach and Influence managers and leaders to consider the implication of their decisions on stakeholders.

 Challenge decisions and actions which are not ethical, explaining the organization risks.

 Encourage transparency in decision-making and communication where possible.

Chartered Fellow Level

 At this level you will:

 Make responsible decisions by balancing different ethical perspectives, and shape how ethics inform wider decision-making and governance.

 Coach and influence senior leaders to consider the ethical impact of their decisions in the short and long-term.

 Take a visible lead in solving ethical dilemmas, considering how they will play out beyond the organization.

 Surface the unsaid in leadership discussions to enable transparency and improved decision making.

Example of Ethics in software engineering:

1. PUBLIC
2. PRODUCT
3. JUDGMENT
4. MANAGEMENT
5. Client and Employer
6. Profession
7. Colleagues
8. Self

PUBLIC:

 Software engineers shall act in a manner that is in the best interests of their client and employer, consistent with the public interest. In particular, software engineers shall, as appropriate:

Accept full responsibility for their own work.

 Moderate the interests of the software engineer, the employer, the client and the users with the public good.

 Be fair and avoid deception in all statements, particularly public ones, concerning software

PRODUCT

 Software engineers shall ensure that their products and related modifications meet the highest professional standards possible. In particular, software engineers shall, as appropriate:

 Strive for high quality, acceptable cost and a reasonable schedule, ensuring significant trade-offs are clear to and accepted by the employer and the client, and are available for consideration by the user and the public.

 Ensure proper and achievable goals and objectives for any project on which they work or propose.

 Ensure that they are qualified for any project on which they work or propose to work by an appropriate combination of education and training, and experience.

 Work to follow professional standards, when available, that are most appropriate for the task at hand, departing from these only when ethically or technically justified.

JUDGMENT

 Software engineers shall maintain integrity and independence in their professional judgment. In particular, software engineers shall, as appropriate:

 Only endorse documents either prepared under their supervision or within their areas of competence and with which they are in agreement.

 Temper all technical judgments by the need to support and maintain human values.

 Maintain professional objectivity with respect to any software or related documents they are asked to evaluate.

 Disclose to all concerned parties those conflicts of interest that cannot reasonably be avoided or escaped.

MANAGEMENT

 Software engineering managers and leaders shall subscribe to and promote an ethical approach to the management of software development and maintenance. In particular, those managing or leading software engineers shall, as appropriate:

 Ensure good management for any project on which they work, including effective procedures for promotion of quality and reduction of risk.

 Ensure that software engineers are informed of standards before being held to them.

 Ensure that software engineers know the employer's policies and procedures for protecting passwords, files and information that is confidential to the employer or confidential to others

Client and Employer

 Software engineers shall act in a manner that is in the best interests of their client and employer, consistent with the public interest.

 In particular, software engineers shall, as appropriate: Provide service in their areas of competence, being honest and forthright about any limitations of their experience and education.

 Not knowingly use software that is obtained or retained either illegally or unethically.

 Use the property of a client or employer only in ways properly authorized, and with the client's or employer's knowledge and consent.

 Ensure that any document upon which they rely has been approved, when required, by someone authorized to approve it.

Profession

 Software engineers shall advance the integrity and reputation of the profession consistent with the public interest.

 In particular, software engineers shall, as appropriate:

 Help develop an organizational environment favorable to acting ethically.

 Promote public knowledge of software engineering.

 Extend software engineering knowledge by appropriate participation in professional organizations, meetings and publications.

 Support, as members of a profession, other software engineers striving to follow this Code.

Colleagues

 Software engineers shall be fair to and supportive of their colleagues. In particular, software engineers shall, as appropriate.

 Encourage colleagues to adhere to this Code.

 Assist colleagues in professional development

 . Credit fully the work of others and refrain from taking undue credit.

 Review the work of others in an objective, candid, and properly- documented way.

Give a fair hearing to the opinions, concerns, or complaints of a colleague.

 Assist colleagues in being fully aware of current standard work practices including policies and procedures for protecting passwords, files and other confidential information, and security measures in general.

Self

 Software engineers shall participate in lifelong learning regarding the practice of their profession and shall promote an ethical approach to the practice of the profession. In particular, software engineers shall continually endeavor to.

 Further their knowledge of developments in the analysis, specification, design, development, maintenance and testing of software and related documents, together with the management of the development process.

 Improve their ability to create safe, reliable, and useful quality software at reasonable cost and within a reasonable time.

 Improve their ability to produce accurate, informative, and well-written documentation.

WEEK-02:

01). Case Study to Understand SDLC On Education Software Development Life Cycle

SDLC or the Software Development Life Cycle is a process that produces software with the highest quality and lowest cost in the shortest time possible. SDLC provides a well-structured flow of phases that help an organization to quickly produce high-quality software which is well-tested and ready for production use.

A software life cycle model (also termed process model) is a pictorial and diagrammatic representation of the software life cycle. The following figure is a graphical representation of the various stages of a typical SDLC.

1. Planning: Collecting Requirements for software.

2. Designing: Defines all the architectural modules of the product along with its communication and data flow representation with the external and third-party modules.

3. Development: Developers start coding the software.

4. Testing: Making sure that software actually works.

5. Deployment: Release the software to the client. First as a beta, which is also a part of testing.

6. Maintenance: After the product is released in the market, its maintenance is done for the existing customer base. WEEK 2 POORVIKA

2 SEPP

2.2 Software Process Model

A software process model is an abstraction of the software development process. a representation of the order of activities of the process and the sequence in which they are performed A model will define the following:

- • The tasks to be performed.
- • The input and output of each task.
- • The pre and post conditions for each task.
- • The flow and sequence of each task.

The goal of a software process model is to provide guidance for controlling and coordinating the tasks

SDLC models followed in the industry-

- • Waterfall Model
- • Iterative Model
- • Spiral Model
- • V-Model
- • Big Bang Model

2) Case Study: Understanding SDLC Using AWS.

Introduction

The Software Development Life Cycle (SDLC) is a systematic process used to design, develop, test, deploy, and maintain software applications. It ensures that software is built in a

structured, efficient, and quality-driven manner. With the evolution of cloud computing, traditional SDLC practices have been enhanced through automation, scalability, and continuous integration.

Amazon Web Services (AWS) is a leading cloud platform that provides a wide range of services supporting every phase of the SDLC. By using AWS, organizations can develop and deploy applications faster, reduce infrastructure costs, and ensure high availability and security. This case study explains how SDLC is implemented using AWS services.

Core Information: SDLC on AWS

SDLC on AWS follows the same core phases as the traditional SDLC model but uses cloud-native tools to optimize each stage. The major SDLC phases include:

1. Requirement Analysis
2. System Design
3. Development
4. Testing
5. Deployment
6. Maintenance

AWS supports these phases through managed services, DevOps tools, monitoring systems, and infrastructure automation, enabling continuous development and delivery.

SDLC Phases Implemented Using AWS

1. Requirement Analysis

In this phase, business needs, functional requirements, and technical constraints are identified. AWS provides architectural guidance and best practices to align requirements with cloud capabilities.

AWS Support:

- AWS Well-Architected Framework for requirement validation
- AWS Cloud Adoption Framework (CAF) for business and technical planning

---

2. System Design

During system design, the application architecture is planned with focus on scalability, security, and performance.

AWS Support:

- Amazon EC2 for compute architecture
- Amazon S3 for scalable storage
- Amazon RDS and DynamoDB for database design
- AWS IAM for identity and access management

---

3. Development

This phase involves writing application code and integrating services.

AWS Support:

- AWS Cloud9 for cloud-based development environment
- AWS CodeCommit for source code version control
- AWS SDKs for application integration
- Containerized development using Amazon ECS or EKS

---

4. Testing

Testing ensures the application meets functional, performance, and security standards.

AWS Support:

- AWS CodeBuild for automated build and test execution
- AWS X-Ray for debugging and performance tracing
- AWS Device Farm for mobile and browser testing

5. Deployment

In this phase, the tested application is released into the production environment.

AWS Support:

- AWS CodeDeploy for automated deployment
- AWS Elastic Beanstalk for managed application hosting
- AWS CloudFormation for Infrastructure as Code (IaC)

6. Maintenance and Monitoring

After deployment, the application is continuously monitored, updated, and optimized.

AWS Support:

- Amazon CloudWatch for monitoring and logging

- AWS Auto Scaling for performance management
- AWS Systems Manager for patching and maintenance

Features of Using SDLC on AWS

- Scalability and high availability
- Cost-effective pay-as-you-go pricing model
- Automated CI/CD pipelines
- Built-in security and compliance standards
- Faster development and deployment cycles
- Improved reliability and fault tolerance

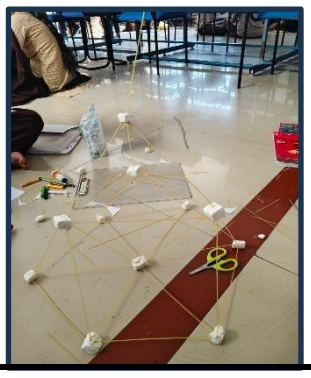
Uses of SDLC on AWS

1. Web and mobile application development
2. Enterprise software systems
3. SaaS product development
4. DevOps and CI/CD implementation
5. E-commerce platforms
6. Data-driven and AI-based applications
7. Secure government and financial systems

Conclusion

Using AWS for implementing the Software Development Life Cycle enhances traditional development practices by introducing automation, scalability, and continuous delivery. AWS services support each SDLC phase efficiently, allowing organizations to reduce operational complexity while improving software quality and performance. By integrating SDLC with AWS, teams can build reliable, secure, and scalable applications that meet modern business demands. This approach demonstrates how cloud computing has become a critical enabler of effective software engineering.

02). Organize and play games to understand the agile process like, Morning wake up game.



A) The Marshmallow Challenges

The marshmallow challenge was introduced by Tom Wujec.

The Purpose of the challenge is to build the Team Coordination, team Work, Patience, Communication and Time Management.

Requirement Needed for this Challenge Was:

a. Spaghetti

b. Marsh Mallow

c. String

d. Tape

e. Scissors

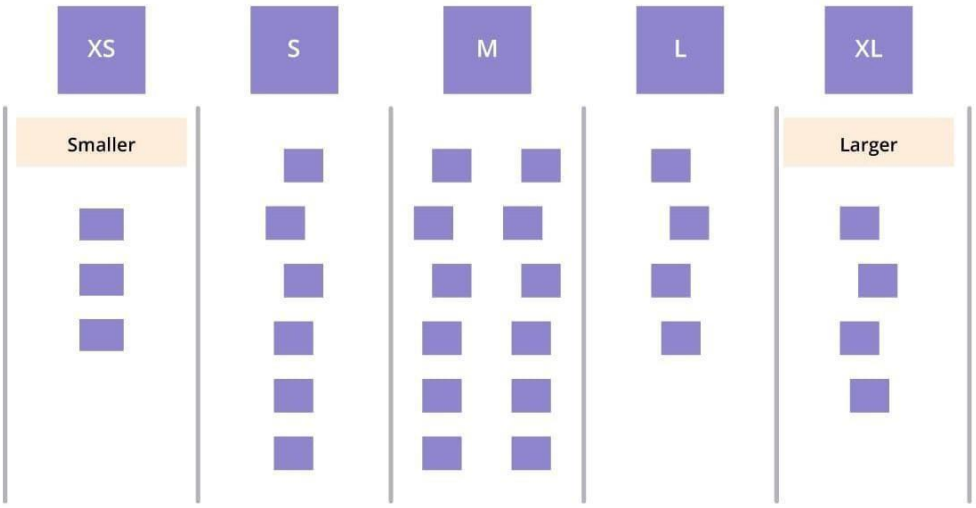
- Build the tallest Free-standing Structure in just 18 minutes using no more than 20 sticks of
- Spaghetti. One yard of Tape, one yard of String, and 11 Marsh Mallow.
- The structure has to stand firmly on its own, it cannot be propped up, Held, or suspended from its ceiling.
- Teams cannot hold on to the Structure when the time runs out. Those touching or supporting the Structure at the end of the exercise will be disqualified.

B) White Elephant Sizing

- White Elephant Sizing game mainly is to get the relative size of an agile project and the size of the individual stories before the project starts.
- It mainly gives opportunity to everyone in the team to raise their voice and contribute equally.

Procedure:

- Create six columns on the board and divide it as XS, S, M, L, and XL.
- The set of prepared user stories (printout) on separate cards. It will be summary with brief description of the different user stories on different cards (tape or sticky notes).
- After the multiple user screens are explained in game. Each person takes one user story from the pile and reads it aloud.
- After reading the person only has a single minute to assign the card to a column. By giving the explanation.
- It will be continued until the user story cards come to 0.



Rules:

1. The person is not allowed to change or shuffle the user card written on the sticky notes.
2. If another person in the hall feels wrong can replace the card placed on the board to different column (by giving a solid reason).
3. The person cannot do any physical damage to the user card which is placed on the board .after explanation.

Game:

The game is based on food application named **Spotify** (only an example).

Summary:

- Mainly the game helps the team to estimate faster. It helps the team feel more confident in completing their estimation work in a set period of time.

C) Easter Egg Challenge

Requirements:

- A4 Size sheet with Egg image
- Scissors
- Pencil
- Colour markers
- Crayons

Procedure:

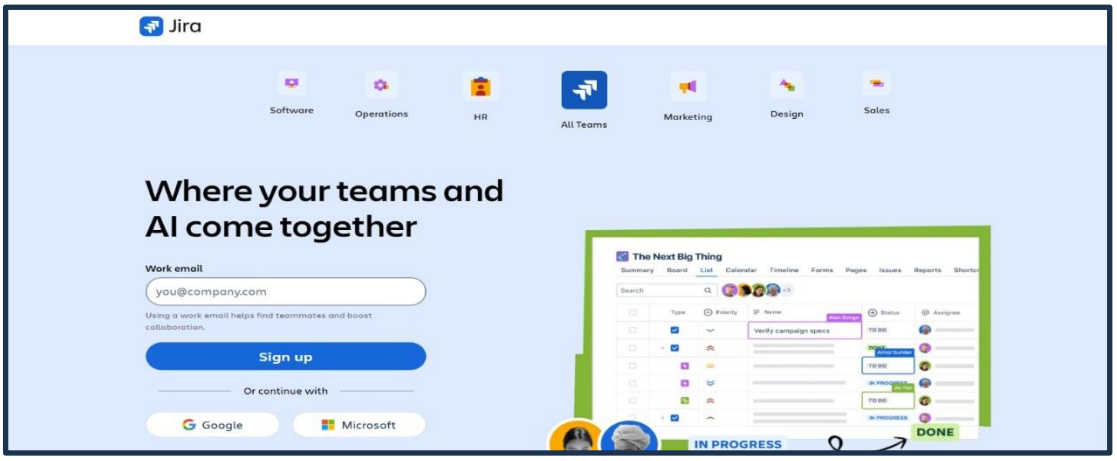
- Groups of 4 or 5 individual per team.
- A bunch of papers with egg image will be given to each team.
- Design the egg.
- Then colour the Easter egg.
- During the challenge the teams will be instructed to deliver the painted eggs according to pre- defined requirements on time and on quality.
- This game should be completed within 10-15 minutes.
- The winner will be considering based on the design and number of Easter Eggs.

---

03). Create Jira (similar tool) Account and learn Interface

Jira software:

JIRA is a software development tool used for **project management** and **issue tracking**. It is a popular tool among software development teams to plan, track, and release software projects. JIRA provides a centralized platform for managing tasks, bugs, and other types of issues and it helps teams to organize and prioritize their work. The tool integrates with other software development tools and has a variety of customizable features and workflows that allow teams to adapt it to their specific needs. Additionally, JIRA also provides various reporting and dashboard features that help teams to stay on top of their work and make Data-driven decisions.



Jira Features:

* JQL (Jira Query Language).

* Creates advanced Dashboards.

* Add-ons allows customized features, unique, design

* Reports.

Creating an Atlassian Account

1. Go to the signup page of Atlassian and enter the required user credentials asked on the site and then click on the Sign Up button.

2. To complete the setup and login, click the verification link in the email box.

3. Set up your Atlassian account.

4. Click on signup after filling details. The account has been created. The user is automatically redirected to the home page.

Interface of Jira Software:

1) Create: You can either create a new epic in agile either use the issues you have created JIRA board

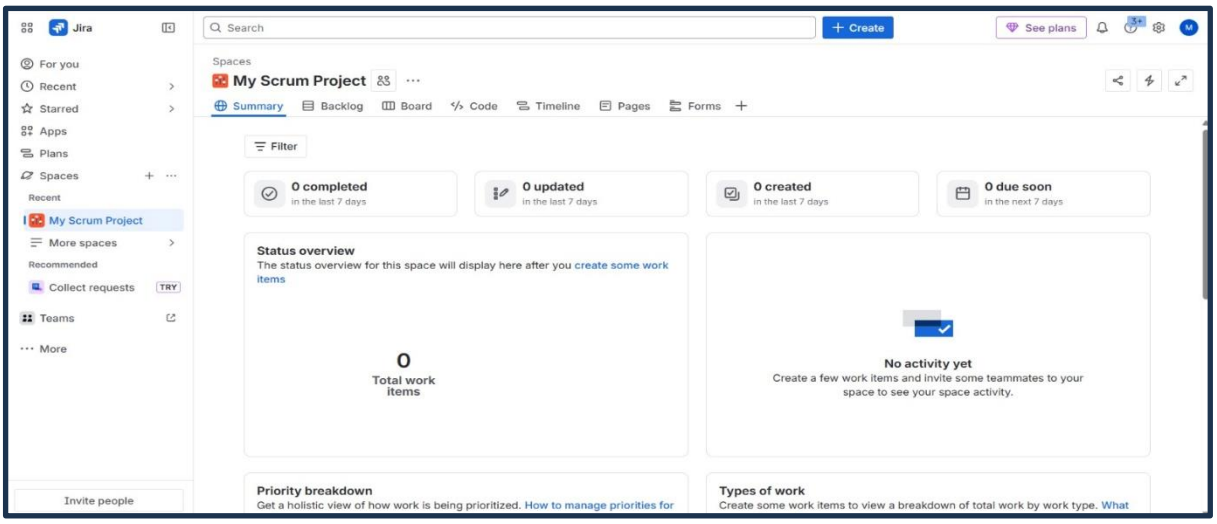
2) Plan: Plan mode display all the user stories create for the project

3) Dashboard: Dashboard is the main display you see when you log in to Jira. You can create multiple dashboards from different projects. OR multiple dashboard one massive overview of all the mark involved with.

4) Project: A project is a simple collection of issues. You would typically you a project to

represent the development work for a product, project or services in Jira software,

5) Roadmap: Road map in Jira software or service are team-level road map useful for planning large pieces of work several months in advance at the Epic level within a single project. Dimple planning and dependency management features help your teams visualize and manage work better together.



6) Backlog: The backlog view lists issues that your team plans to work on (and the backlog. Sprint lists) as well as the issues currently your team's board on you use the backlog issue list to plan work in advance so that team members can quickly jump tasks when they're ready.

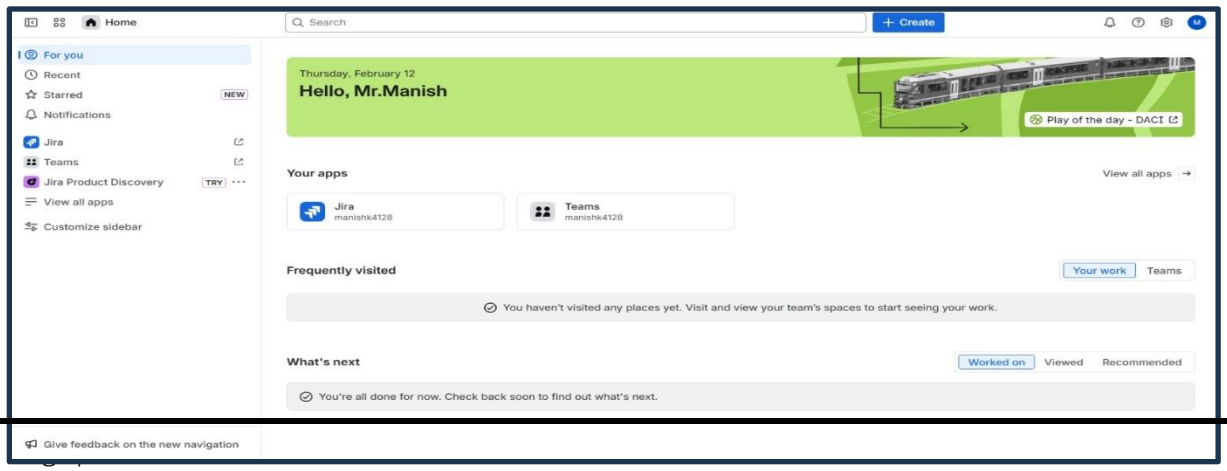
7) Active sprint: The Active sprints of the issues that you're a your on the most Scrum board displays team is currently working on. You can create and update issues, and drag and drop issues to transition them through a workflow.

8) Reports: Reports in Jira software are offers critical insights for scrum, Kanban, and any agile methodology in between sprint report burn down chart, release burn down, velocity chart. Control charts etc.

9) Issues: A Jira work in issue represents a single piece of a project, Time tracking allows! Teams to record the amount of time they spend working on issues. Teams can create custom workflows to drive the progression of issues

10) Releases: A scrum or Kanban board. Releases represent paints in time for your project. They can be used to schedule how Features are rolled out to your customers! a way to organize work that has been completed for the project.

11) Project Settings: Once, You have created a project, you can Configure it to suit the needs of your team or to adopt to a new piece of work. Your team Can use Jira projects to coordinate the development product, track a project, manage a help of a desk, and more.



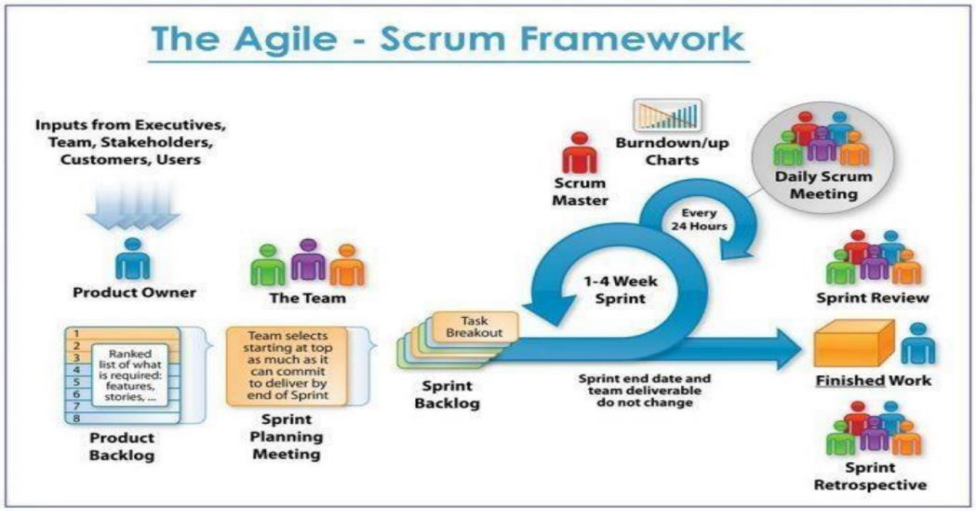
WEEK -03:

01). Play and Act Agile Ceremonies:

Introduction

Chrome is a popular web browser developed by Google, first released in 2008.It's known for its minimalist design, speed, and user-friendly interface. Chrome supports multiple operating system, including windows, macOS, Linux, iOS, and Android.

Agile ceremonies:



- Agile sprint ceremonies are essential components of a successful agile project.
- Agile ceremonies are meetings where a development team comes together to keep each other updated on their project's details. At the same time, other Scrum ceremonies, such as the sprint retrospective, helps the scrum team look back on their work and find ways of improving for future sprints.
- The purpose of these meetings is to review progress, discuss issues, and make decisions.
- Sprint ceremonies also provide a platform for team members to collaborate, share ideas, and learn from each other. They are a key part of the agile development process and involve all stakeholders in the project.

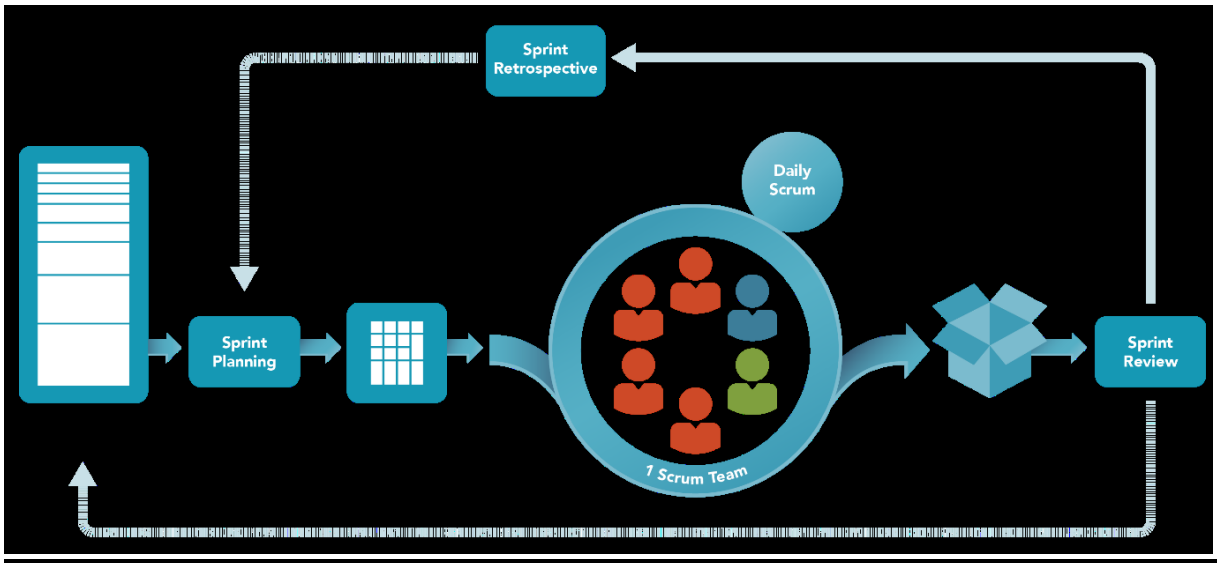
Feature:

- **Profile Login:** Login for your Profile through Gmail account
- **Home screen:** Main Screen of Chrome website
- **Address Bar:** Enters URLs to visit website or search terms to perform a web search.
- **New Tabs (+):** You can open a new tab
- **New Incognito Tab:** This tab is to maintain privacy and will help in auto clear browse history when we close the tab
- **Download Tab:** This tab allows you to view downloaded file and can access it.
- **History :** Holds the user browser history
- **Reading List:** You'll find your reading list here
- **Password Manager:** Here we can save and Manage passwords which are used to

login websites

- **Bookmarks:** We can save site address as bookmark for quick accesses the site in future
- **Recent Tabs:** Shows the recently used and closed tabs
- **Others Features:** like Desktop site, Translate, settings, Whats new…

PROCESS:



1. **Product Backlog Creation:** The Product Owner collaborates with stakeholders to create and prioritize a list of requirements called the Product Backlog.

2. **Sprint Planning:** At the beginning of each sprint, the Scrum Team conducts a Sprint Planning meeting to select items from the Product Backlog to work on during the sprint.

The Development Team determines how much work they can complete and creates a Sprint Backlog.

3. **Sprint backlog:** The Development Team works on the items selected during the Sprint Planning meeting, aiming to deliver a potentially shippable product increment by the end of the sprint

4. **Daily Stand-up:** This is a daily brief meeting guided by the scrum master where the team shares the status of the work. All of the members synchronize their advances by answering 3 questions: what did I did yesterday? What will I do today? And what blockers do I have to move forward? The scrum master handles the blockers that appear and helps the team to keep the development process of the software in a continuous flow.

5**. Sprint Review:** At the end of the sprint, the Scrum Team demonstrates the completed work to stakeholders during the Sprint Review meeting. Feedback is gathered, and adjustments are made to the Product Backlog as needed.

6. **Sprint Retrospective:** Immediately following the Sprint Review, the Scrum Team conducts a Sprint Retrospective meeting to reflect on the sprint and identify areas for improvement in the next sprint.

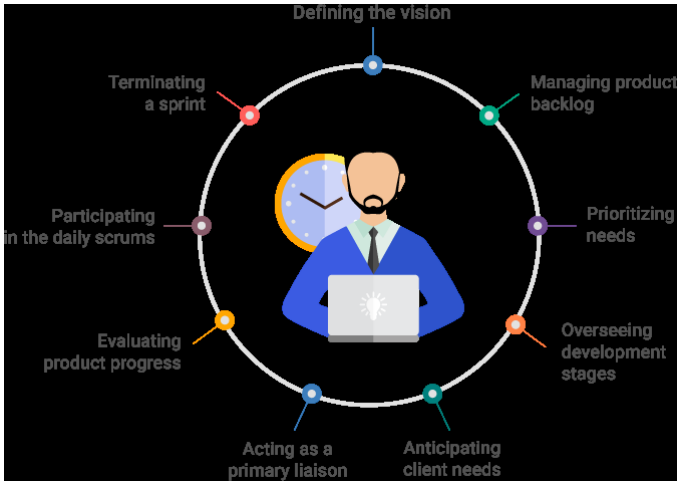
02). Play Different Agile Roles Eg. Product Owner, Business Analyst

The two key pillars for a successful agile project are the Product Owner (PO) and the Business Analyst.

PRODUCT OWNER:

A product owner is a role on a Scrum team that is responsible for the project's outcome.

The product owner seeks to maximize a product's value by managing and making product best and effective



ROLES AND RESPONSIBILITY OF A PRODUCT OWNER:

1. **Defining the vision:** The agile product owner is the person on the product development team, using their high-level perspective to define goals and create a vision for development projects.

2. **Managing the product backlog:** One of the most important responsibilities for a scrum product owner is managing the product backlog.

3. **Prioritizing needs:** Another key role of the product owner is to prioritize needs. In other words, they must prioritize the triangle of scope, budget, and time, weighing priorities according to the needs and objectives of stakeholders.

4. Overseeing development stages: With the vision, strategy, and product priorities set, the product owner should spend a significant amount of time overseeing the actual development of the product. They are a key player throughout each event, including planning, refinement, review, and sprint

SOFT SKILLS NEEDED TO A PRODUCT OWNER:

- Communication
- Technical Skills.
- Decision-Making.
- Project Management Skill.
- Collaboration

BUSINESS ANALYST:

Agile business analyst is about increasing the delivery of business value to the stakeholders of the project or product being developed.

ROLE OF A BUSINESS ANALYST IN AGILE:

- Maintain the focus on business value
- Identify missing requirements
- Coach the Product Owner (on work)
- Coach the development team (on business domain)
- Help define acceptance criteria before work starts
- Solving Business Problems
- Looking for Savings and Efficiencies
- Focusing on Business Development

- Performance Analysis
- Competitor Analysis

SOFT SKILLS OF A BUSINESS ANALYST ARE:

Analytical thinking and Problem Solving-solving, creative thinking, systems thinking, learning and decision making

1. **Behavioural Characteristics** -ethics, personal organisation and trustworthiness.

2. **Business Knowledge-**business principles & practice, industry knowledge, organisation knowledge and solution knowledge.

3. **Communication Skills-**oral communication, written communication and teaching.

4. **Interaction Skills-facilitation** & negotiation, leadership & influencing and teamwork.

5. **Software Applications**-general purpose applications and specialised application.

WEEK -04:

01). Case study to understand the Importance of Risk Management and Risk Mitigation.

CASE STUDY ON LENSKART:-

Lenskart is a prominent Indian eyewear company founded in 2010. Operating both online and offline, it offers a diverse range of eyeglasses, sunglasses, contact lenses, and accessories. With an Omni-channel presence, Lenskart provides a virtual try-on feature, home eye check-up services, and emphasizes technology integration. The company has in-house brands, collaborates with designers, and focuses on customer loyalty through personalized services and exclusive programs. Lenskart has become a leading player in the Indian eyewear market, known for its innovative approach and diverse product offerings.

RISKS FOR LENSKART:

A. Supply Chain Disruptions:

- Dependence on a single supplier or region can lead to disruptions in the supply chain, affecting product availability.

B. Cybersecurity Threats:

- With the increasing frequency of cyber-attacks, there is a risk of data breaches and potential compromise of customer information.

C. Market Competition:

- Intense competition in the eyewear industry poses a threat to market share and profitability for Lenskart.

RISK MITIGATION:

A. Supply Chain Disruptions:

- Diversification of Suppliers: Engaging with multiple suppliers across different regions reduces the reliance on a single source, mitigating the impact of supply chain disruptions.
- Advanced Inventory Management: Implementing real-time inventory management systems helps Lenskart anticipate and address supply chain issues promptly.

B. Cybersecurity Threats:

- Advanced Security Measures: Investing in advanced cybersecurity technologies, including encryption and firewalls, fortifies Lenskart's defences against cyber threats.

- Employee Training: Conducting regular training programs ensures that employees are aware of cybersecurity best practices, reducing the risk of human errors.

C. Market Competition:

- Market Analysis and Adaptation: Continuous market analysis allows Lenskart to adapt its strategies, ensuring it stays ahead of competitors.
- Customer Loyalty Initiatives: Implementing personalized services and loyalty programs
- enhances customer loyalty, providing a competitive edge.

After Implementing Risk Mitigation Strategies:

A. Enhanced Supply Chain Stability:

- Diversifying suppliers and implementing advanced inventory management has improved Lenskart's supply chain stability, minimizing disruptions and ensuring a consistent product supply.

B. Heightened Cybersecurity Resilience:

- Advanced security measures and employee training have significantly reduced the risk of cybersecurity threats, safeguarding customer data and maintaining trust.

C. Improved Competitive Positioning:

- Market analysis and customer loyalty initiatives have strengthened Lenskart's competitive positioning, leading to increased market share and customer retention.

Conclusion:

Lenskart's proactive risk management approach has resulted in a more resilient and competitive business. The company is now better equipped to navigate challenges, ensuring a stable supply chain, robust cybersecurity, and a strong market presence. This not only safeguards Lenskart against potential threats but also positions the company for sustainable growth in the eyewear industry.

02). How to use tool to manage and mitigate risks [e.g.: logic gate, board]

Logic gate:

It is a software where you keep all the information is in one system (logic gate).it includes policies, goals& priorities.

Or

Logic gate’s controls management solutions gives your risk and control owners a break from the disorganized mess of spreadsheet email and documents.

Working:

1. It will work from single central hub.

2. It will according to the industry standard control frameworks (ISCF).

For example:

1. Management wants task ‘E” to be done on priority but the employee gets the email after 2 days about priority.

Advantage:

By using logic gates everyone gets information at real time.

1. Emails:

Logic gates can be used for emails as well.

2. If we find any risk then we can plan &everyone can work on real time.

It’s a rapid session where team will monitor, control assessments, gather evidence and much more, right in the platform. They will continuously collaborate and share information such

WEEK -05:

1). Conduct warmup activities to Ignite Design Thinking

<u>Pyramid Balance Challenge</u>

Objective:
Players must build a pyramid using paper cups, all while keeping a balloon in the air by continuously tapping it up. The game tests coordination, balance ,and multitasking skills.

Setup:

- A stack of paper cups
- A balloon
- A flat surface (table or floor)

How to Play:

1. The player starts with all materials placed in front of them.
2. As soon as the timer starts, they must throw the balloon up and keep it in the air by tapping it.
3. While balancing the balloon, they must build a pyramid by using paper glasses.
4. The pyramid must have at least 5 layers (or more).
5. If the pyramid collapses or the balloon touches the ground, they must restart.
6. The game ends when a player successfully builds the pyramid while keeping the balloon in the air.

Winning Conditions:

- Successfully build a stable pyramid without dropping the balloon.
- Fastest time wins (for competitive play).

Game Variations:

- **Solo Challenge:** Beat your own time.
- **Versus Mode:** Two players compete side by side.
- **Extreme Mode:** Add more balloons or use only one hand for balancing.

Snatch the Object Challenge

Snatch the Object is a competitive and energetic game that involves two teams trying to grab an object placed on a table positioned between them. The team that successfully grabs the object first wins the round. It is a fun game that combines speed, strategy, and teamwork.

How to Play:

1. Setup:

- Divide the players into two teams of equal size.
- Place a table at the centre, with an object (e.g., bottle) sitting on top.
- Each team lines up on opposite sides of the table, facing the object.

2. Rules:

- On a signal (e.g., "Go!" or a whistle), both teams will race towards the table.
- The objective is to be the first to grab the object from the table.
- The player who touches or grabs the object first wins the round for their team.

3. Winning:

- The team that successfully snatches the object first wins the round.
- You can play several rounds and keep score to determine the overall winner.

Materials Required:

- A table
- An object to be placed on the table
- A whistle or signal device to start the game

Benefits:

- **Physical Activity:** This game promotes exercise and helps players improve their speed, agility, and coordination.

WEEK -06:

01). Organize role play for requirement activities

UTS-IR UNRESERVED TICKETING SYSTEM:

- Unreserved Ticketing System (UTS) is a mobile application launched in 2014 by the Center for Railway Information System (CRIS), a subsidiary body of Indian Railways, to generate or cancel unreserved train tickets, book seasonal tickets, renew passes, and purchase platform tickets.
- Unreserved Ticketing System (UTS) is an official Android/IOS mobile ticketing app to book unreserved train tickets

Requirement for Application:

- To use the UTS (Unreserved Ticketing System) app for Indian Railways, typically, you need a smartphone running Android or iOS. Here are general requirements:
    - Smartphone:
    - Internet Connection
    - IRCTC Account
    - Mobile Number
    - Payment Method

Role Play for UTS App:

- **User** (you): I'm a daily commuter, and I need to book an unreserved ticket for my upcoming journey using the UTS App.
- **Me** (UTS help): Sure, let's go through the process. Could you please open the UTS app and log in with your credentials?
- **User**: I've logged in. Now, how do I start booking my ticket?
- **Me**: Great! On the homepage, you'll find an option for ticket booking. Tap on that, and it should guide you to choose your destination and ticket type. Where are you planning to travel today?
- **User**: I'll be heading from Station A to Station B.
- **Me**: Perfect. Now, select the ticket type (e.g., adult, child) and proceed to the payment

section. Make sure to choose a convenient payment method.

- **User**: Alright, I've selected an adult ticket and entered my payment details. What's next?
- **Me**: Once you complete the payment, you should receive a confirmation screen. Your digital ticket will be available in your profile. Ensure everything looks correct, and you're all set for your journey.
- **User**: Got it! Thanks for guiding me through the process. Anything else I should know?
- **Me**: You're welcome! If you encounter any issues or need assistance, feel free to check the app's help section or contact customer support. Safe travels!

02). Identify a problem and prepare requirement document or Epics and user stories

Problem faced by UTS App:

1. As of my last knowledge update in January 2022, specific problems reported in the Unreserved Ticketing System (UTS) can vary, and I don't have real-time data. However, common issues faced by users in railway ticketing systems, including UTS, might include:
2. **Technical Glitches:** Users may experience technical issues such as app crashes, slow response times, or connectivity problems, impacting their ability to use the application effectively.
3. **Booking Failures:** Issues related to failed ticket bookings, payment failures, or incomplete transactions can cause frustration among users.
4. **User Authentication:** Some users might encounter difficulties during the sign-up or login process, leading to accessibility problems.
5. **Limited Features:** Users may express concerns about the lack of certain features, such as real-time updates, better navigation, or additional payment options.
6. **Security Concerns:** Users may raise concerns about the security of their personal and payment information when using the app, especially during the payment process.

Epic: UTS (Unreserved Ticketing System)

User Stories:

1. Splash Screen

Task:

 A splash screen is an introduction page is used to display logo of an application

2. Location Access

Task:

 Allows the location while using the app and User should give access to location in order to receive the location updates and exact location.

3. Home Page

Task:

 Upon logging in, I want to be directed to the app's homepage, where I can easily navigate to different features such as ticket booking, schedules, Cancel Ticket, Booking History, Notifications, Show Tickets, R-Wallet, Profile, Transactions and my account.

4. Language Selection:

Task:

 As a multilingual user, I want the option to choose my preferred language in the UTS app settings, ensuring a comfortable and accessible experience.

5. Log in

Task:-

 Log In into the application if you don't have an account

 As a new user, I want to sign up easily on the UTS app by providing necessary details, allowing me to create a personalized account for ticket booking and management.

 Sign in if you already have an account or Sign in or Log in using phone number and Gmail account

6. User Profile and Account:

Task:-

 As a user, I want to access and edit my profile details in the UTS app, allowing me to manage my account information, preferences, and view my transaction history.

7. Payment

Task:-

 Customer should have online payment through R-Wallet or UPI

03. Configure JIRA for the managing the project to solve the identified problem
